# Data Intake Report

Name: Diabetes dataset deployment

Report date: 24-09-2022

Internship Batch: LISUM13: 30 Data intake by: Jay Panara

Data intake reviewer: Data Glacier

Data storage location: https://github.com/jaypanara/Data\_Glacier\_Internsip/tree/main/Week4

### **Tabular data details:**

Total number of observations	786
<b>Total number of files</b>	1
<b>Total number of features</b>	1
Base format of the file	.csv
Size of the data	24KB

Note: Replicate same table with file name if you have more than one file.

# **Proposed Approach:**

• Used decision tree classifier for prediction.

```
from google.colab import drive
drive.mount('/content/drive')
```

Drive already mounted at /content/drive; to attempt to forcibly remount, call drive.m

**→** 

```
import numpy as np
import pandas as pd
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
import sklearn
from sklearn.model_selection import train_test_split
from sklearn import metrics
dataset = pd.read_csv('/content/drive/MyDrive/diabetes.csv')
```

#### dataset

The following code is executed in the VS code which trains the model for the prediction:

```
modelpy > ...

import numpy as np

import matplotlib.pyplot as plt

import sklearn

from sklearn import metrics

from sklearn.tree import DecisionTreeClassifier

dataset = pd.read_csv('diabetes.csv')

train_data=dataset.drop(columns=["Outcome","BloodPressure",'skinThickness','DiabetesPedigreeFunction','Glucose'])

output_data"dataset['Outcome']

# select algorithm

model = DecisionTreeClassifier()

# fit model to the data

model.fit(train_data, output_data)

model.fit(train_data, output_data)

model = pickle.dump(model, open('model.pkl','wb'))

model = pickle.load(open('model.pkl','vb'))

model = pickle.load(open('model.pkl','rb'))

After that app.py is executed which results in the following output:

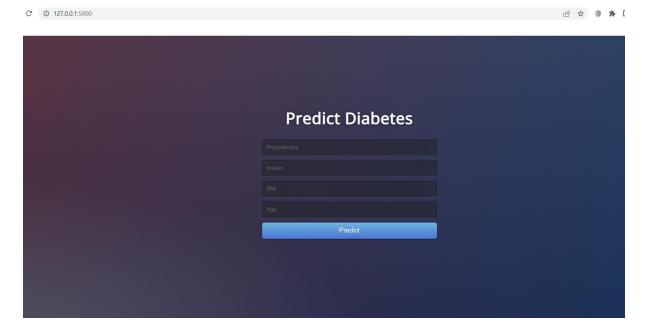

```
🅏 app.py >
       app = Flask(__name__)
       model = pickle.load(open('model.pkl', 'rb'))
       @app.route('/')
       def home():
          return render_template('index.html')
       @app.route('/predict',methods=['POST'])
       def predict():
           For rendering results on HTML GUI
           int_features = [int(x) for x in request.form.values()]
           final_features = [np.array(int_features)]
prediction = model.predict(final_features)
           result = (prediction[0])
               output="No Diabetes"
            output="Diabetes"

On opening the given url we get the following page:

On entering the details we get the results if the patient has diabetes or not:
